

Blow Up For Higher Order Parabolic Hyperbolic Dispersion And Schrodinger Equations Monographs And Research Notes In Mathematics

Yeah, reviewing a ebook **blow up for higher order parabolic hyperbolic dispersion and schrodinger equations monographs and research notes in mathematics** could grow your close associates listings. This is just one of the solutions for you to be successful. As understood, expertise does not recommend that you have wonderful points.

Comprehending as skillfully as treaty even more than other will find the money for each success. adjacent to, the revelation as competently as keenness of this blow up for higher order parabolic hyperbolic dispersion and schrodinger equations monographs and research notes in mathematics can be taken as with ease as picked to act.

Blow-up for Higher-Order Parabolic, Hyperbolic, Dispersion and Schrödinger Equations shows how four types of higher-order nonlinear evolution partial differential equations (PDEs) have many commonalities through their special quasilinear degenerate representations. The authors present a unified approach to deal with these quasilinear PDEs.

Blow-up for Higher-Order Parabolic, Hyperbolic, Dispersion ...

Keywords: Blow-up rate; Higher-order; Parabolic equation; Parabolic system; Fujita-type theorem 1. Introduction In this paper, we study the blow-up rates of the higher-order semilinear parabolic equation $u_t + (\mu - |u|^p)_x = 0$, $0 < t < T$, $u(x, 0) = u_0(x)$, $u_0 \in L^q(\mathbb{R}^N)$, (1.1) as well as the system $u_t + (\mu - |u|^p)_x + (\nu - |v|^q)_y = 0$, $0 < t < T$, $u(x, 0) = u_0(x)$, $v(y, 0) = v_0(y)$, $u_0 \in L^q(\mathbb{R}^N)$

Blow-up rates for higher-order semilinear parabolic ...

Structure of boundary blow-up for higher-order quasilinear parabolic equations. Proceedings of the Royal Society of London. Series A: Mathematical, Physical and Engineering Sciences, Vol. 460, Issue. 2051, p. 3299.

Saint-Venant's principle in blow-up for higher-order ...

We show that, in contrast to the solutions of the classical second-order parabolic equations $u_t = u_{xx} + up$ and $u_t = u_{xx} + eu$ from combustion theory, the blow-up in their higher-order counterparts is asymptotically self-similar. In particular, there exist exact nontrivial self-similar blow-up solutions, $u^*(x, t) = (T - t)^{-1/(p-1)} f(y)$ in the case of the polynomial nonlinearity and $u(x, t) = -\ln(T - t) + f(y)$ for the exponential nonlinearity, where $y = x / (T - t)^{1/2m}$ is the ...

Blow-up for Higher-Order Parabolic, Hyperbolic, Dispersion ...

Abstract We consider the higher-order semilinear parabolic equation $\partial_t u = -(\Delta)^m u + u|u|^{p-1}$, $\partial_t u = -(\Delta)^m u + u|u|^{p-1}$, in the whole space \mathbb{R}^N , where $p > 1$ and $m \geq 1$ is an odd integer. We exhibit type I non self-similar blowup solutions for this equation and obtain a sharp description of its asymptotic behavior ...

Construction of type I blowup solutions for a higher order ...

The aim of this thesis is to locate the blow-up points and study the local behavior of blow-up solutions to the following higher order Liouville equations: $\partial_t u = -\Delta u = \dots = 0$ on dCt , where Ω is a bounded smooth domain in \mathbb{R}^N and $f(x)$ is a positive function on Ω . with certain smooth conditions, $0 < A < C$ for some constant C .

Locating the Blow-up Points and Local Behavior of Blow-up ...

blow-up set for problem (1.1). In particular, we show the relationship between the blow-up set and higher order derivatives of the initial data. Before stating our main results, we introduce some notation. For any $x \in \mathbb{R}^N$ and $r > 0$, we denote the open ball radius of r and center x by $B(x, r)$. Let $\overline{BC_+}(\Omega)$ be the set of nonnegative bounded continuous functions on

Effect of higher order derivatives of initial data on the ...

title = "Existence and blow-up for higher-order semilinear parabolic equations: Majorizing order-preserving operators",

Existence and blow-up for higher-order semilinear ...

As for the solid fuel model (1.1), the structure of such a blow-up singularity formation is of importance in the present higher-order model. From the Cambridge English Corpus Total wave collapse will take place provided the blow - up singularity does not occur at times earlier than the collapse predicted by the virial theorem.

Blow-up for Higher-Order Parabolic, Hyperbolic, Dispersion and Schrödinger Equations shows how four types of higher-order nonlinear evolution partial differential equations (PDEs) have many commonalities through their special quasilinear degenerate representations. The authors present a unified approach to deal with these quasilinear PDEs. The book first studies the particular self-similar singularity solutions (patterns) of the equations. This approach allows four different classes of nonlinear PDEs to be treated simultaneously to establish their striking common features. The book describes many properties of the equations and examines traditional questions of existence/nonexistence, uniqueness/nonuniqueness, global asymptotics, regularizations, shock-wave theory, and various blow-up singularities. Preparing readers for more advanced mathematical PDE analysis, the book demonstrates that quasilinear degenerate higher-order PDEs, even exotic and awkward ones, are not as daunting as they first appear. It also illustrates the deep features shared by several types of nonlinear PDEs and encourages readers to develop further this unifying PDE approach from other viewpoints.

The monograph is devoted to the study of initial-boundary-value problems for multi-dimensional Sobolev-type equations over bounded domains. The authors consider both specific initial-boundary-value problems and abstract Cauchy problems for first-order (in the time variable) differential equations with nonlinear operator coefficients with respect to spatial variables. The main aim of the monograph is to obtain sufficient conditions for global (in time) solvability, to obtain sufficient conditions for blow-

up of solutions at finite time, and to derive upper and lower estimates for the blow-up time. The monograph contains a vast list of references (440 items) and gives an overall view of the contemporary state-of-the-art of the mathematical modeling of various important problems arising in physics. Since the list of references contains many papers which have been published previously only in Russian research journals, it may also serve as a guide to the Russian literature.

* Introduces a state-of-the-art method for the study of the asymptotic behavior of solutions to evolution partial differential equations. * Written by established mathematicians at the forefront of their field, this blend of delicate analysis and broad application is ideal for a course or seminar in asymptotic analysis and nonlinear PDEs. * Well-organized text with detailed index and bibliography, suitable as a course text or reference volume.

Our analysis adapts the robust energy method developed for the study of energy critical bubbles by Merle-Rapha"el-Rodnianski, Rapha"el-Rodnianski and Rapha"el-Schweyer, the study of this issue for the supercritical semilinear heat equation done by Herrero-Vel´azquez, Matano-Merle and Mizoguchi, and the analogous result for the energy supercritical Schr"odinger equation by Merle-Rapha"el-Rodnianski.

This book addresses the global study of finite and infinite singularities of planar polynomial differential systems, with special emphasis on quadratic systems. While results covering the degenerate cases of singularities of quadratic systems have been published elsewhere, the proofs for the remaining harder cases were lengthier. This book covers all cases, with half of the content focusing on the last non-degenerate ones. The book contains the complete bifurcation diagram, in the 12-parameter space, of global geometrical configurations of singularities of quadratic systems. The authors' results provide - for the first time - global information on all singularities of quadratic systems in invariant form and their bifurcations. In addition, a link to a very helpful software package is included. With the help of this software, the study of the algebraic bifurcations becomes much more efficient and less time-consuming. Given its scope, the book will appeal to specialists on polynomial differential systems, pure and applied mathematicians who need to study bifurcation diagrams of families of such systems, Ph.D. students, and postdoctoral fellows.

The present book carefully studies the blow-up phenomenon of solutions to partial differential equations, including many equations of mathematical physics. The included material is based on lectures read by the authors at the Lomonosov Moscow State University, and the book is addressed to a wide range of researchers and graduate students working in nonlinear partial differential equations, nonlinear functional analysis, and mathematical physics. Contents Nonlinear capacity method of S. I. Pokhozhaev Method of self-similar solutions of V. A. Galaktionov Method of test functions in combination with method of nonlinear capacity Energy method of H. A. Levine Energy method of G. Todorova Energy method of S. I. Pokhozhaev Energy method of V. K. Kalantarov and O. A. Ladyzhenskaya Energy method of M. O. Korpusov and A. G. Sveshnikov Nonlinear Schr"odinger equation Variational method of L. E. Payne and D. H. Sattinger Breaking of solutions of wave equations Auxiliary and additional results

Sobolev spaces become the established and universal language of partial differential equations and mathematical analysis. Among a huge variety of problems where Sobolev spaces are used, the following important topics are the focus of this volume: boundary value problems in domains with singularities, higher order partial differential equations, local polynomial approximations, inequalities in Sobolev-Lorentz spaces, function spaces in cellular domains, the spectrum of a Schrodinger operator with negative potential and other spectral problems, criteria for the complete integration of systems of differential equations with applications to differential geometry, some aspects of differential forms on Riemannian manifolds related to Sobolev inequalities, Brownian motion on a Cartan-Hadamard manifold, etc. Two short biographical articles on the works of Sobolev in the 1930s and the foundation of Akademgorodok in Siberia, supplied with unique archive photos of S. Sobolev are included.

Overview of current developments in nonlinear photorefractive optics. The book dicusses exciting discoveries, with special emphasis on transverse effects such as spatial soliton formation and interaction, spontaneous pattern formation and pattern competition in active feedback systems. Different aspects of potential applications, such as wave guiding in adaptive photorefractive solitons and techniques for pattern control for information processing, are also described.

This work examines the mathematical aspects of nonlinear wave propagation, emphasizing nonlinear hyperbolic problems. It introduces the tools that are most effective for exploring the problems of local and global existence, singularity formation, and large-time behaviour of solutions, and for the study of perturbation methods.
