Use of the dosing strategy recommended by the 2009 consensus panel (i.e., optional 25–30 mg/kg load followed by ~15 mg/kg TBW every 8–12 hrs) in the obese population resulted in excessive trough concentrations (higher than 20 mg/L) in at least 50% of obese patients overall as well as in 79% of those requiring ICU care. 63 Using a revised obesity dosing protocol (20–25 mg/kg TBW load followed by 10 mg/kg TBW every 12 hrs), achievement of initial troughs of 10–20 mg/L numerically ...

Handbook of Lung Targeted Drug Delivery Systems: Recent Trends and Clinical Evidences covers every aspect of the drug delivery to lungs, the physiology and pharmacology of the lung, modelling for lung delivery, drug devices focused on lung treatment, regulatory requirements, and recent trends in clinical applications. With the advent of nano sciences and significant development in the nano particulate drug delivery systems there has been a renewed interest in the lung as an absorption surface for various drugs. The emergence of the COVID-19 virus has brought lung and lung delivery systems into focus, this book covers new developments and research used to address the prevention and treatment of respiratory diseases. Patients, obtaining drug information, and pharmacy ethics. Case examples throughout the text show how skills are applied in clinical situations, and every chapter concludes with self-assessment questions. Chapters are also sequenced in a skill-building approach, so the development of each skill depends on the integration and application of previous skills. Chapters are organized in a practical, skill-building approach. Case examples provide an understanding of how the material may be applied. Self-assessment questions are included for each chapter. Learning objectives help readers focus on important concepts. Quick reference guides help readers locate key pieces of information. Complete coverage of patient-centered clinical pharmacy skills helps readers understand and clearly define the skills needed in the pharmacy setting. New visuals/figures give the book

Have you ever wondered if you calculated your patient's dosage correctly? Against a backdrop of the growing scrutiny of appropriate dosages, this textbook takes a fresh, new approach to helping health professionals strengthen care to and possibly save the lives of patients living with pain. This easy-to-understand and often humorous book is the most comprehensive to-date on opioid calculations for pain management and palliative care. It carefully walks clinicians through a five-step process for performing opioid conversion calculations in the real-world situations they often see. The book has case examples, simple charts and tables, and practice problems throughout on topics such as:

- difficult conversions for methadone, fentanyl, PCA, and neuraxial opioid therapy
- conversions between routes and dosage formulations of the same opioids and different opioids.

Written by pain management expert Dr. Mary Lynn McPherson, the book gives helpful tips that practitioners should incorporate into their practices. It is a must for clinicians at all levels: hospice and palliative care physicians, physician's assistants, nurses, nurse practitioners, and pharmacists. Clinicians will come away with more confidence in doing the calculations, and higher service levels from the improvement in care.

This Clinical Handbook for the Management of Mood Disorders will equip clinicians with the knowledge to refine their diagnostic skills and implement treatment plans for mood disorders based on the most up-to-date evidence on interventions that work.

Covering the widest range of treatments and techniques, it provides clear guidance for the management of all types and subtypes of both minor and major depression. Chapters cover the latest and most innovative treatments, including use of ketamine, deep brain stimulation and transcranial magnetic stimulation, effective integration of pharmacological and psychotherapeutic approaches, as well as providing a thought-provoking look at the future research agenda and the potential for reliable biomarkers. This is the most comprehensive review of depression available today. Written and edited by leading experts mostly from Columbia University, this is an essential resource for anyone involved in the care and treatment of patients with mood disorders.

The prevalence of diabetes is on the

Patients increase in the UK and worldwide, partly due to changes in lifestyle which predispose individuals to overweight and obesity. It is estimated that about 90% of the currently diagnosed adults have type 2 diabetes, and based on the World Health Organisation (WHO) report, about 422 million adults were living with diabetes in 2014 compared with 108 million in 1980; this condition caused about 1.5 million deaths in 2012. In the United States of America, it is estimated that about 30.3 million adults are living with diabetes, with a further 1.5 million new diabetes cases diagnosed every year, representing an increasing prevalence of this condition. Diabetes represents a major public health challenge, despite advances in technology and the pharmaceutical industry. These problems may be in the form of acute or long-term complications. Therefore, in order to attenuate the problems of

diabetes, management strategies usually include lifestyle changes such as increased physical activity and dietary interventions. Studies which evaluate the role of nutrition in the management of type 2 diabetes often involve human and animal models as these approaches enable us to have a broader and more in-depth understanding of the condition. In some cases, diabetes may co-exist with other conditions, such as stroke, and these may present unique challenges with regard to nutritional interventions. This Special Issue aims to evaluate the risk factors associated with type 2 diabetes and the role of the diet in the management of people with this condition. This evidence is drawn from both human and animal studies.

Discovery and Evaluation” The completely revised new edition of the volume reflects the current state of the art in Clinical Pharmacology. Drug Discovery and Evaluation has become a more and more difficult, expensive and time-consuming process. The effect of a new compound has to be detected by in vitro and in vivo methods of pharmacology. The activity spectrum and the potency compared to existing drugs have to be determined. As these processes can be divided up stepwise we have designed a book series "Drug Discovery and Evaluation" in the form of a recommendation document. Clinical pharmacokinetics are performed in parallel with human studies on tolerability and therapeutic effects. Special studies according to various populations and different therapeutic indications are necessary. These items are covered in the

third volume: „Methods in Clinical Pharmacology". For the 2nd edition of this volume, the chapters have been revised and completely updated. A large number of assays were added. New chapters were included, such as pain, addiction, gene therapy, orphan diseases.
