Method Validation - Eurachem

Validation of a method is the confirmation by examination and the provision of objective evidence that the particular requirements for a specific intended use are fulfilled (3). It is important as it defines whether it will produce reliable results in the context of its intended use.

Method verification consists of partial validation. It should be performed for a validated method under following conditions: When an already validated method is used on a product for the first time. Change of active ingredient supplier, change in method of synthesis, reformulation of a drug product When an already validated method is used in a laboratory for the first time. In some cases method transfer may be preferred. 04-09-2016

The United States Pharmacopeia (USP) defines method validation as a process by which it is established, through laboratory studies, that the performance characteristics of a method meet the requirements for its intended analytical applications. The USP goes on to state that Method Validation typically evaluates the following analytical characteristics of a method: Accuracy, Precision, Specificity, Detection Limit,

Method Validation Vs. Verification: What's The Difference?

When it comes to validation, analytical test methods used for medicinal products based on biological molecules can be a bit 'tricky' to deal with. Coming up with a suitable design for the validation protocol can be quite difficult. In particular, the choice of what parameters to investigate, and the design of the associated experiments.
