ISO 10816 Vibration Severity Chart

ISO 10816-1 is the basic document describing the general requirements for evaluating the vibration of various machine types when the vibration measurements are made on non-rotating parts. This part of ISO 10816 provides specific guidance for assessing the severity of vibration measured on bearings, bearing pedestals, or housings of industrial machines when measurements are made in situ .

When evaluating the general vibration of the the is generally tested [mm/s] (frequency bandwidth between 10Hz and 1000Hz). This technique is generally sufficient. The limit values for the vibration severity values are defined by ISO 10816-1 depending on motor classes. The vibration condition is classified as follows:
