A linear first-order p.d.e. on two variables x, y is an equation of type $a(x,y) u_x + b(x,y) u_y = c(x,y)u(x,y)$. We will be able to solve equations of this form; in fact of a slightly more general form, so called quasi-linear: $a(x,y,u) u_x + b(x,y,u) u_y = c(x,y,u)$. 2 Solution.

The present volume is self-contained and introduces to the treatment of linear and nonlinear (quasi-linear) abstract evolution equations by methods from the theory of strongly continuous semigroups. The theoretical part is accessible to graduate students with basic knowledge in functional analysis. Only some examples require more specialized knowledge from the spectral theory of linear, self-adjoint operators in Hilbert spaces.
