Excerpt from Manual of Meteorology, Vol. 4: Meteorological Calculus; Pressure and Wind (a Revised Edition of Part IV, 1919) The volume now presented is a revised edition of Part IV which was issued in advance in 1919. There are besides two chapters introductory to the theory of motion under balanced forces which had been adopted in Part iv as the basis of the relation between pressure and wind, and two chapters supplementary, summing up the position with regard to the theory of

the general circulation of the atmosphere and its local disturbances. Here we need only account for the limitations of the work now ended. Its purpose was to give the reader an idea of the general problem of the meteorology of the globe and of the material and methods which are available for its solution. More narrowly stated the problem is to provide a rational quantitative explanation of the sequence of the phenomena of weather in any locality - its first stage to trace the phenomena to their natural causes and identify the physical and dynamical processes by which the sequence is controlled. In Nature the account which has been given of the physical processes of weather in Vol.III has been called discursive, and with at least equal

justice the epithet may be applied to the account of the dynamical processes in this last volume; and there is no reason for resentment on that account. Fifty years ago similar remarks were often made about Maxwell's Theory of Heat, "an extraordinary textbook," the perusal of which may even now be recommended to students of meteorology as a good resolution for every New Year, though neither author nor editor nor publisher (up to 1891) had found himself able to make an index to it. Nature is herself very discursive in the demands which she makes upon her various sciences for providing the sequence of our weather. The book does not aspire to be regarded as an abstract even of meteorological literature, still less of dynamical or physical. It adheres as

strenuously as circumstances permit to the idea of weather as a manifestation of the transformations of energy taking place in the atmosphere. This revised text presents a cogent explanation of the fundamentals of meteorology, and explains storm dynamics for weather-oriented meteorologists. It discusses climate dynamics and the implications posed for global change. The new edition features a companion website with MATLAB® exercises and updated treatments of several key topics. Much of the material is based on a two-term course for seniors majoring in atmospheric sciences. KEY FEATURES Lead author Gregory J. The weather can be a cause of disruption, despair and even danger everywhere around the world at one time or another. Even when benign it is a source of constant fascination. Applied Atmospheric Dynamics connects this interest with the theoretical underpinnings of fluid dynamics; linking real physical events as diverse as Hurricane Katrina and the strong katabatic winds of Antarctica, with quantitative conceptual models of atmospheric behaviour. Assuming only basic calculus the book provides a physical basis for understanding atmospheric motions around the globe as well as detailing the advances that have led to a greater understanding of

weather and climate. The accompanying supplementary CD-ROM features colour graphics, maps, databases, animations, project materials, as well as weather data tips. Covers the standard theoretical principles of atmospheric dynamics and applies the theory to global real world examples Assumes only non-vector based calculus Features supplementary CD-ROM with electronic versions of all figures, case study data and possible term projects An invaluable text for students of Meteorology, Atmospheric Science, Geography and Environmental Science A Solutions Manual is also available for this textbook on the Instructor Companion Site www.wileyurope.com/college/lynch
