First-order Partial Differential Equations 1.1 Introduction Let $u = u(q_1, \dots, q_n, x_1, \dots, x_n)$ be a function of n independent variables q_1, \dots, q_n . A Partial Differential Equation (PDE for short) is an equation that contains the independent variables q_1, \dots, q_n , the dependent variable or the unknown function u and its partial derivatives up to some order.

PARTIAL DIFFERENTIAL EQUATIONS—Sharif
This course is an introduction to partial differential equations (PDEs). PDEs originated as the mathematical description of various physical systems, e.g., heat diffusion, vibrations of a string or membrane, fluid flow, the motion of an electron, etc.

440 Introduction to Partial Differential Equations
In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 + 3x + 2 = 0$. However, it is usually impossible to write down explicit formulas for solutions of partial differential equations.

A partial differential equation is an equation that involves x , u , and partial derivatives of u . Quite often, x represents only spatial variables. However, many equations are evolutionary, meaning that $u = u(x, t)$ depends also on time t and the PDE has time derivatives.
