This manual provides technical protocols for musculoskeletal research on a translational basis, i.e. a disease-orientated approach. It offers guidance on various laboratory techniques, including cell culture and molecular biology, histology and histomorphometry, microscopy and bioimaging, laboratory animal models, CT- and MRI-based densitometry and microarchitectural analysis, biomechanics and functional analysis of orthopedic kinesiology, etc. The content is simple and straightforward, with illustrations and step-by-step procedures as an easy experimental reference for personnel in basic and clinical musculoskeletal research and education. This book will provide a unique multidisciplinary platform for various professions — not only orthopedics, but also biomedical engineering and biomaterial sciences — involving both basic and clinical medicine.

Nine out of every ten medical students, residents, and fellows attempt to write a manuscript during their training. Yet, after finishing the training only 1 or 2 would continue to write scientific manuscripts due to the effort involved in preparing a manuscript. Most medical students, residents, fellows, and even junior faculty consider writing a scientific manuscript harder than working grueling hours on the clinical service. The manual of scientific manuscript writing was developed to guide for medical students, residents, fellows, and junior faculty by providing a step by step pathway for successful preparation of a manuscript. The manual is expected to reduce the usual 3 and 6 months (at times frustrating) effort to a 1 to 2 week streamlined process to complete a manuscript.

The book has two intentions. First, it assembles the latest research in the field of medical imaging technology in one place. Detailed descriptions of current state-of-the-art medical imaging systems (comprised of x-ray CT, MRI, ultrasound, and nuclear medicine) and data processing techniques are discussed. Information is provided that will give interested engineers and scientists a solid foundation from which to build with additional resources. Secondly, it exposes the reader to myriad applications that medical imaging technology has enabled.

In today ' s healthcare environment, the real driver is value. Maximizing outcomes and minimizing costs or providing similar outcomes with lower cost in terms of actual numbers or recovery time will dominate our healthcare delivery system. An excellent example of this evolution is in the ?eld of cardiovascular intervention. Dr. Jacques Kpodonu ' s Manual of Thoracic Endo-Aortic Surgery is a most timely and descriptive work in this burgeoning ?eld. It provides an excellent overview of current technology and techniques, plus the endovascular expert can drill down into the details of the devices and technologies described and signi?cantly enhance their knowledge and perspective. Procedural detail, excellent graphics, pertinent imaging studies, and relevant instruction are the mainstays of this text. The ?rst chapter comprises the key overview and very comprehensively covers the platform – the hybrid OR, the tools, the accessories, and the medium – superb, state-of-the-art imaging modalities required to perform these advanced procedures. The text then moves into more technical details including options and instruction regarding access approaches and potential pitfalls of such. This is followed in en- ing chapters by dissemination of precise information, techniques, and indications for the most popular and utilized grafts including Boston Relay Stent Graft, Cook TX2 Zenith Stent Grafts, as well as the Gore and Medtronic Aortic Stent Grafts.

In this book every urologic procedure is described in a step-by-step sequence of events. The text is supplemented with numerous tips, colored illustrations and high definition photographs depicting the main steps of the procedures. The aim of this manual is to provide the Urologic Surgeon with the state-of-the-art of Laparoscopic Surgery. It guides the reader through every stage of the laparoscopic procedure, from the equipment's settings to the correct position of the needle on the needle holder.

Contouring, treatment planning, and treatment delivery are documented in a range of everyday cases, with illustrations of slice-by-slice delineations on planning CT images and finalized treatment plans based on detailed acceptance criteria. Numerous practical tips are highlighted, and relevant information is included on surgical techniques and systemic therapies. The book will facilitate decision making in the management of patients with common thoracic malignancies and assist in overcoming the challenges encountered in daily clinical practice.
